

Search Results & Categories

Search Amazon and scrape category pages with structured results

The Search endpoint performs keyword searches on Amazon and returns structured product listings. This works for both search queries and category pages; since Amazon category pages use the same underlying structure as search results, this single endpoint handles both use cases. Get product titles, prices, ratings, Prime status, sponsored flags, and position rankings all in clean JSON format.

Endpoint

GET <https://api.scrape.do/plugin/amazon/search>

Input Parameters

Parameter	Type	Required	Description
token	string	*	Your Scrape.do API authentication token
keyword	string	*	Search query (must be URL-encoded)
geocode	string	*	Country code (e.g., us, gb, de, jp)
zipcode	string		Postal code formatted according to country requirements. Omit to skip the ZIP-locked session; the delivery location then follows the rotator's IP and may vary between requests.
page	integer		Page number for pagination (default: 1)
super	boolean		Enable residential/mobile proxies for higher success rates. Costs 10x credits (default: false)

Parameter	Type	Required	Description
language	string		Language code in ISO 639-1 format (e.g., EN, DE)
include_html	boolean		When true, the response includes the full raw HTML of the page after the structured JSON output (default: false)

Response Parameters

Field	Type	Description
keyword	string	The search query that was executed
page	number	Current page number
totalResults	string	Total results count as displayed by Amazon
products	array	List of product results
status	string	Request status (success or error)
errorMessage	string	Error message if request failed
html	string	Full raw HTML of the Amazon page (only present when include_html=true)

Product Object Fields

Field	Type	Description
asin	string	Product ASIN number

Field	Type	Description
title	string	Product title
url	string	Product detail page URL
imageUrl	string	Product thumbnail image URL
price	object	Price with currencyCode and amount
rating	object	Rating with value, count, and stars. Note that count currently returns 0; use the reviewCount field below for the review total.
reviewCount	string	Number of reviews as displayed by Amazon (e.g. (9.1K)). This is the field to use for the review total. Returns null when a product has no ratings yet.
isSponsored	boolean	Whether this is a sponsored/ad placement
isPrime	boolean	Whether Prime shipping is available
position	number	Position on the search results page
badge	string	Special badge if present (e.g., "Best Seller", "Overall Pick")

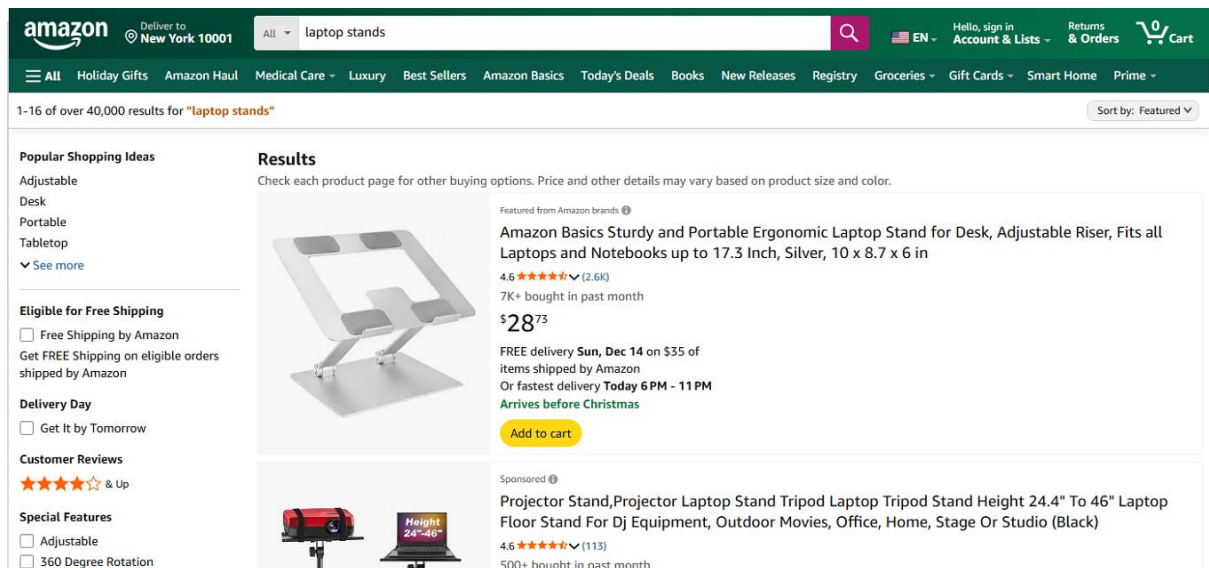

Example Usage

Step 1: Define Your Search Query

Decide what you want to search for on Amazon. This can be:

- Product keywords: laptop stands, wireless headphones, coffee maker
- Brand + product: sony headphones, anker charger
- Category browsing: Use category-specific keywords

For this example, we'll search for "laptop stands":

The API will return structured data for each product in the search results, including ASINs, prices, ratings, and badges like "Best Seller" or "Overall Pick".

Step 2: Send the API Request

```
curl --location --request GET
```

```
'https://api.scrape.do/plugin/amazon/search?token=<SDO-  
token>&keyword=laptop%20stands&geocode=US&page=1'
```

Step 3: Receive Structured Search Results

The API returns a paginated list of products with all relevant details:

```
{  
  "keyword": "laptop stands",  
  "page": 1,  
  "totalResults": "1-16 of over 10,000 results",  
  "products": [  
    {  
      "asin": "B0C1HGKNG7",  
      "title": "Adjustable Laptop Stand for Desk, Ergonomic Computer Riser...",  
      "url": "https://www.amazon.com/dp/B0C1HGKNG7",  
      "imageUrl": "https://m.media-amazon.com/images/I/71abc123.jpg",  
      "price": {
```

```
"currencyCode": "USD",
"amount": 29.95
},
"rating": {
  "value": 4.6,
  "count": 0,
  "stars": 5
},
"reviewCount": "(9.1K)",
"isSponsored": false,
"isPrime": true,
"position": 1,
"badge": "Overall Pick"
},
{
  "asin": "B0CBL1TQMP",
  "title": "Portable Laptop Stand, Foldable Aluminum Computer Holder...",
  "url": "https://www.amazon.com/dp/B0CBL1TQMP",
  "imageUrl": "https://m.media-amazon.com/images/I/61xyz789.jpg",
  "price": {
    "currencyCode": "USD",
    "amount": 18.99
  },
  "rating": {
    "value": 4.4,
    "count": 0,
    "stars": 4
  },
}
```

```
"reviewCount": "(2.3K)",
"isSponsored": true,
"isPrime": true,
"position": 2,
"badge": null
},
{
  "asin": "B0D7EXAMPLE",
  "title": "Heavy Duty Laptop Stand with Cooling Fan...",
  "url": "https://www.amazon.com/dp/B0D7EXAMPLE",
  "imageUrl": "https://m.media-amazon.com/images/I/51def456.jpg",
  "price": {
    "currencyCode": "USD",
    "amount": 45.99
  },
  "rating": {
    "value": 4.8,
    "count": 0,
    "stars": 5
  },
  "reviewCount": "(567)",
  "isSponsored": false,
  "isPrime": false,
  "position": 3,
  "badge": "Best Seller"
}
],
"status": "success",
```

```
"errorMessage": null  
}
```

Pagination

To get additional pages of results, increment the page parameter:

```
/plugin/amazon/search?token=...&keyword=laptop%20stands&geocode=us&zipcode=14217&page=2
```

The `isSponsored` field helps you distinguish between organic results and paid placements. The `position` field shows the exact ranking on the page.

Use the `reviewCount` field (for example (9.1K)) for the number of reviews.

The count inside the rating object currently returns 0, so it should not be used as the review total. Products that have no ratings yet return null for `reviewCount`.

Search keywords must be URL-encoded. Response is limited to a maximum of 4MB.

Add `include_html=true` to your request to receive the full raw HTML of the Amazon search results page alongside the structured JSON output. The HTML will be included in an `html` field at the end of the response.
